

BIG DATA AND PREDICTIVE ANALYTICS FOR HOSPITAL MANAGEMENT

Hans Levenbach, Delphus, Inc.

Agenda

- **Role of Big Data in Predictive Analytics**
 - Big Data Applications
 - Patient Care Activity: Geography, Payer Class & Product Lines
 - Multiple Competitor & Product Mix Forecasting
 - Multi-State & Migration Perspectives
 - Physician Activity & Multiple Physician Ranking
 - Berger Commission Type Simulations
 - A Big Data and Reporting Framework For Hospital Management
- **A Modeling Pathway For Healthcare Providers**
 - **P**reparing Healthy Data
 - **E**xecuting Analytic Treatments
 - **E**valuating Performance Diagnostics
 - **R**econciling Multiple Modeling Pathways
- **Implications for Forecasting Research**
 - Curing Unhealthy Data - missing, inaccurate, inconsistent, and intermittent
 - Creating Structured Datasets - Related hierarchies for Product, Place and Period
 - M++ Competitions Next? –scaling of 'large' flat datasets & normality as the exception.

Big Data Usage Examples

(in petabytes)

- The world's effective capacity to exchange information through two-way telecom networks was 281 petabytes of (optimally compressed) information in 1986, 471 petabytes in 1993, 2,200 petabytes in 2000, and 65,000 (optimally compressed) petabytes in 2007
 - ***this is the informational equivalent to every person exchanging 6 newspapers per day!***
- Internet:** Google processes about 24 petabytes of data per day
- Telecoms:** AT&T transfers about 30 petabytes of data through its networks each day
- Physics:** The experiment in the Large Hadron Collider produce about 15 petabytes of data per year, which will be distributed over the LHC Computing grid
- Neurology:** It is estimated that the human's brain's ability to store memories is equivalent to about 2.5 petabytes of binary data
- Climate science:** The German Climate Computing Centre (DKRZ) has a storage capacity of 60 petabytes of climate data¹
- Archives:** The internet archive contains about 5.8 petabytes of data as of December 2010. It was growing at the rate of about 100 terabytes per month in March 2009
- Film:** The 2009 movie Avatar is reported to have taken over 1 petabyte of local storage at Weta Digital for the rendering of the 3D CGI effects
 - In August 2011, IBM was reported to have built the largest storage array ever, with a capacity of 120 petabytes
 - In January 2012, Cray began construction of the Blue Water Supercomputer, which will have a capacity of 500 petabytes making it the largest storage array ever if realized!

How Big Is a Petabyte?

A petabyte (derived from the SI prefix *peta*) is a unit of information equal to one quadrillion bytes, or 1024 terabytes.

The unit symbol for the petabyte is PB. The prefix *peta* (P) indicates the fifth power to 1000.

According to IBM:
Everyday, we create 2.5 quintillion bytes of data—so much that 90% of the data in the world today has been created in the last two years alone

Multiples of bytes V·T·E				
SI decimal prefixes		Binary	IEC binary prefixes	
Name (Symbol)	Value	usage	Name (Symbol)	Value
kilobyte (kB)	10^3	2^{10}	kibibyte (KiB)	2^{10}
megabyte (MB)	10^6	2^{20}	mebibyte (MiB)	2^{20}
gigabyte (GB)	10^9	2^{30}	gibibyte (GiB)	2^{30}
terabyte (TB)	10^{12}	2^{40}	tebibyte (TiB)	2^{40}
petabyte (PB)	10^{15}	2^{50}	pebibyte (PiB)	2^{50}
exabyte (EB)	10^{18}	2^{60}	exbibyte (EiB)	2^{60}
zettabyte (ZB)	10^{21}	2^{70}	zebibyte (ZiB)	2^{70}
yottabyte (YB)	10^{24}	2^{80}	yobibyte (YiB)	2^{80}

Predictive Analytics For Healthcare Applications

Predictive analytics encompasses a variety of techniques from data mining, statistics, and game theory that analyze current and historical facts to make predictions about future events.

“We have to bring the science of management back into healthcare”

Donald Berwick, MD
Institute of Healthcare Improvement

Step 1: Preparing Healthy Data: **Centralized Data Source for NY Hospital Applications - SPARCS**

The annual OUTPATIENT.ZIP file from SPARCS is 700 MB s and expands to 18 gigabytes in a text file format.

The annual INPATIENT.ZIP file from SPARCS is 500 MB and expand to 7 GB in a text flat file format.

- How many hospitals?: New York 268, Connecticut over 30, New Jersey over 140
- How many patient records per year?: NY inpatient Records over 2.5 million
- How many lowest level records in the demand table if we had all hospitals SQL with SPARCS data?

Typical Database Sizes in Supply Chain Organizations

Wal-Mart has 5,000 Stores, 100,000 items, and if a typical store carries a full line of items, then you can then potentially expect

500,000,000 lowest level records

If an online Store has 6 Distribution Centers and 35,000 Items, and each distribution center carries a full line of items, one can then expect

210,000 lowest level records

For NY Hospitals, with five years of history and approximately 100 services and 23 products we end up with 220,000 lowest level records

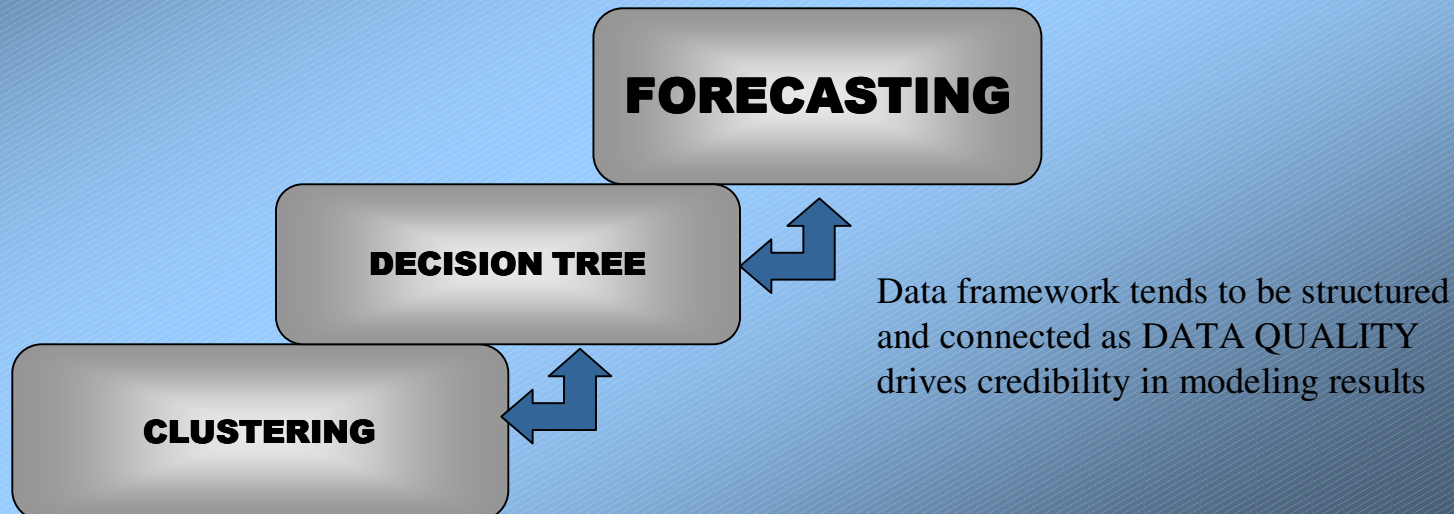

Step 2: Executing Analytic Treatments:

Predictive Analytic Methods Tend To Be Data-Driven

The use of current and past data, in conjunction with statistical, structural or other analytical models and methods, to determine the likelihood of certain future events

As you move up the steps, the complexity of the approaches increases while the volume of data decreases

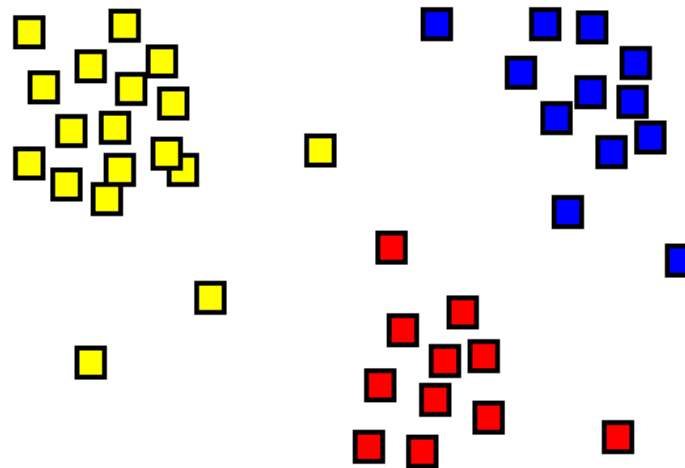

Big Data Techniques

Cluster Analysis

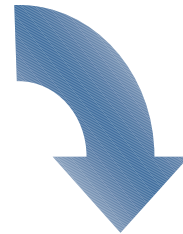

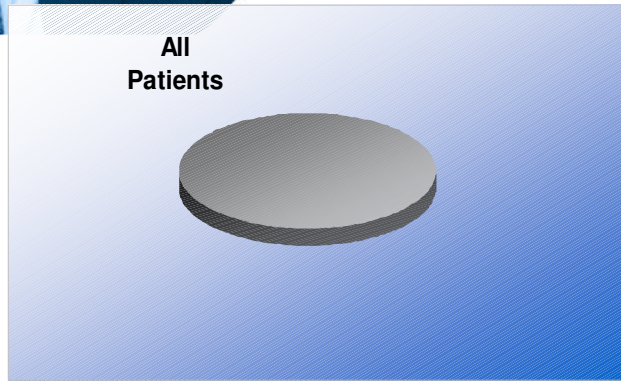

Cluster analysis or clustering is the assignment of a set of observations into subsets (called clusters) so that observations in the same cluster are similar in some sense. Clustering is a method of unsupervised learning, and a common technique for statistical data analysis used in many fields, including machine learning, data mining, pattern recognition, image analysis and bioinformation.

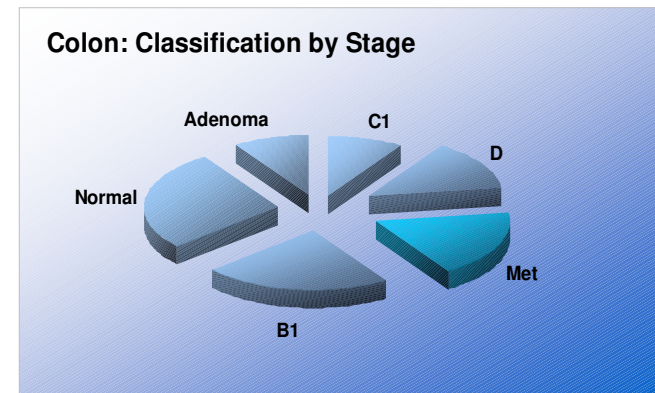

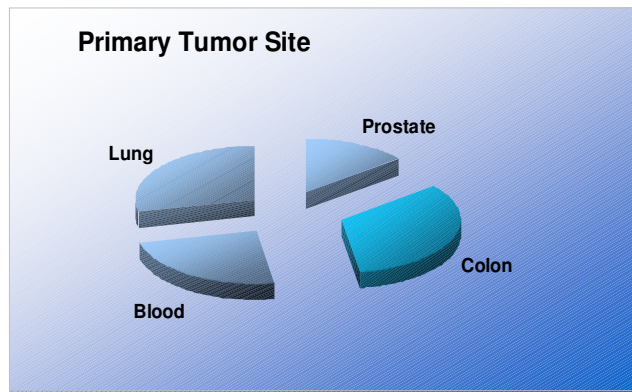

Decision Trees: Progressive Class Distinction

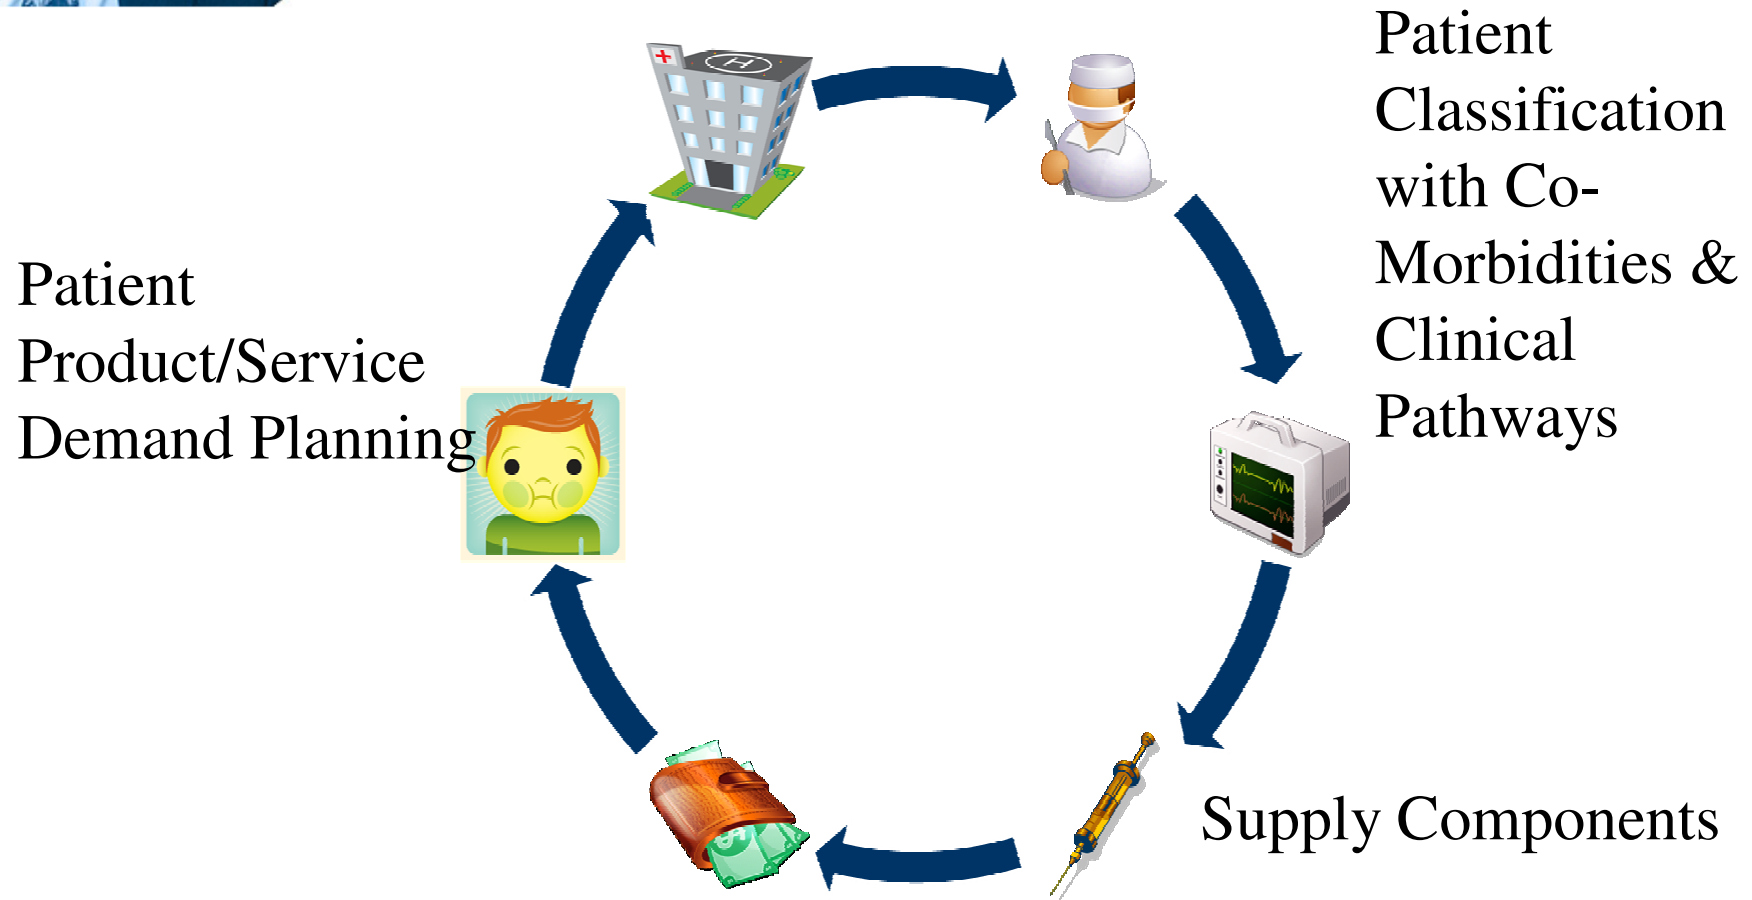

→ Descend tree using any available differentiating attributes; natural, derived or inferred; separately or in combination

→ > 100 product line/service combinations

Patient-centric Demand Forecasting For Hospital Management

Applications in Healthcare

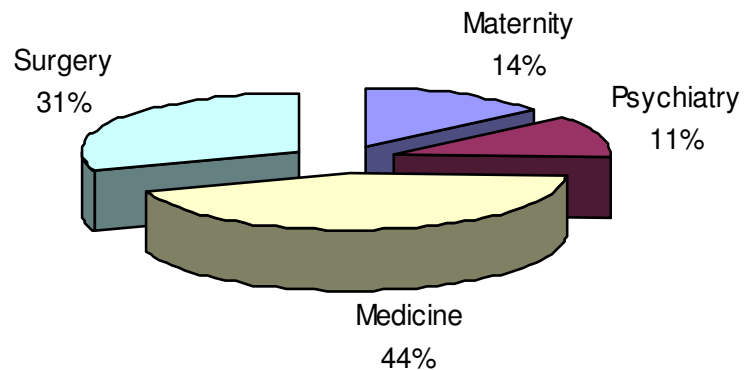

Understanding medical prevalence, we can predict
Admissions --> Co-Morbidities --> Physician Work Flow -->
Product/Service Mix --> Supply Chain requirements

- Patient Care Activity: Geography, Payer Class & Product Lines
- Multiple Competitor & **Product Mix Forecasting**
- Physician Activity & Multiple Physician Ranking
- Multi-State & Migration Perspectives
- Berger Commission Type Simulations – e.g. Hospital Closings

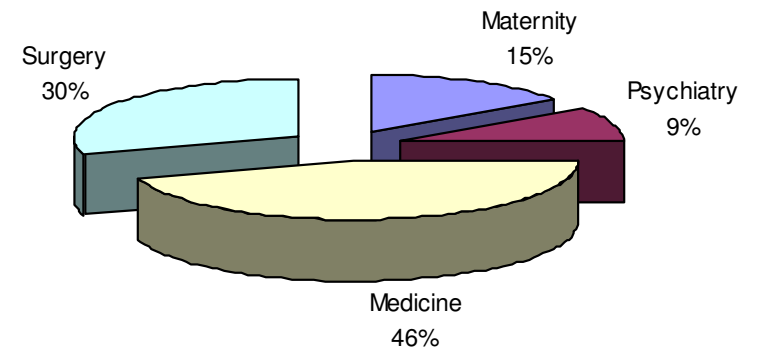

Product Mix and Service Need

Service Mix for First Year

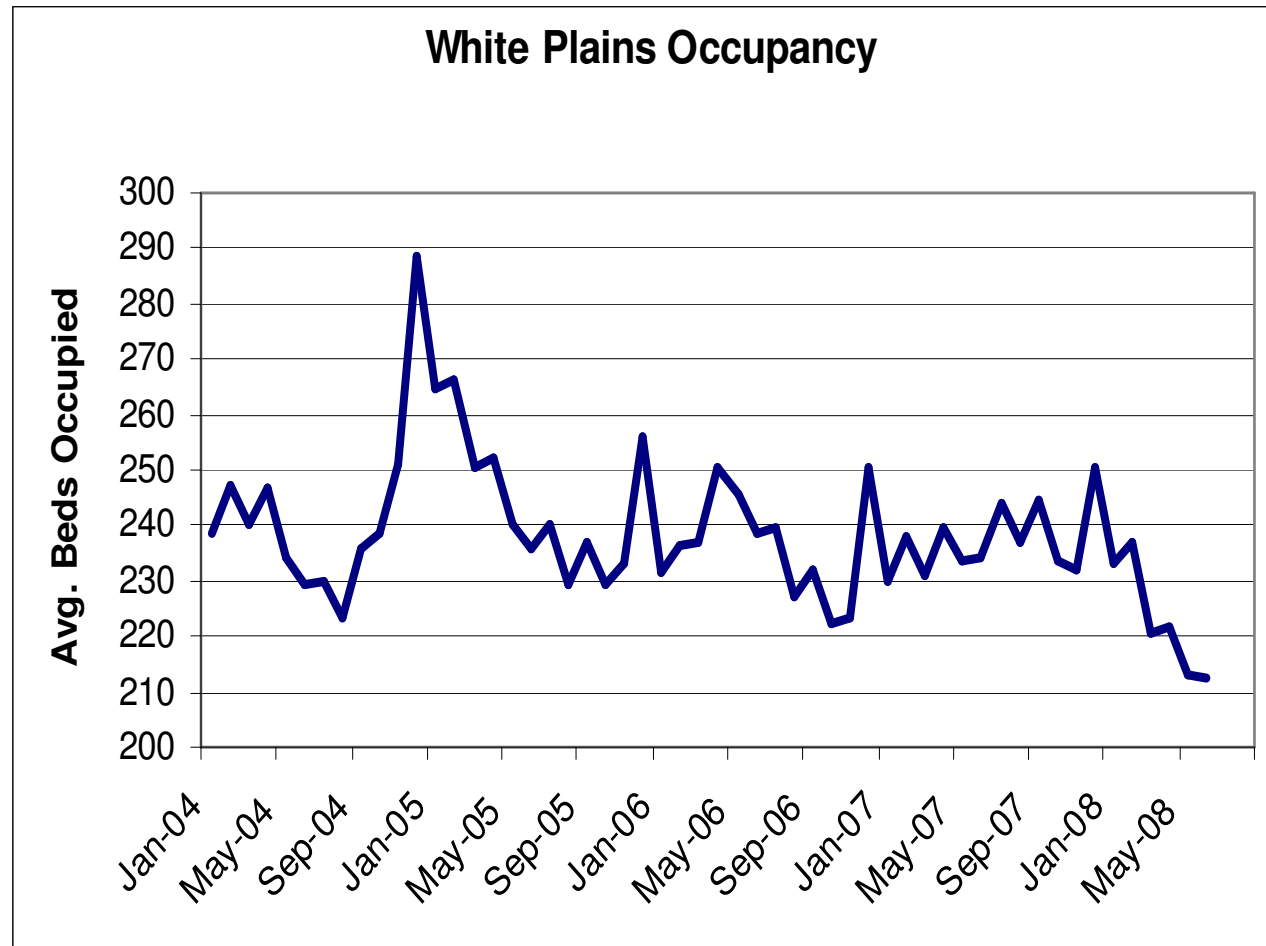

Service Mix for Forecast Year

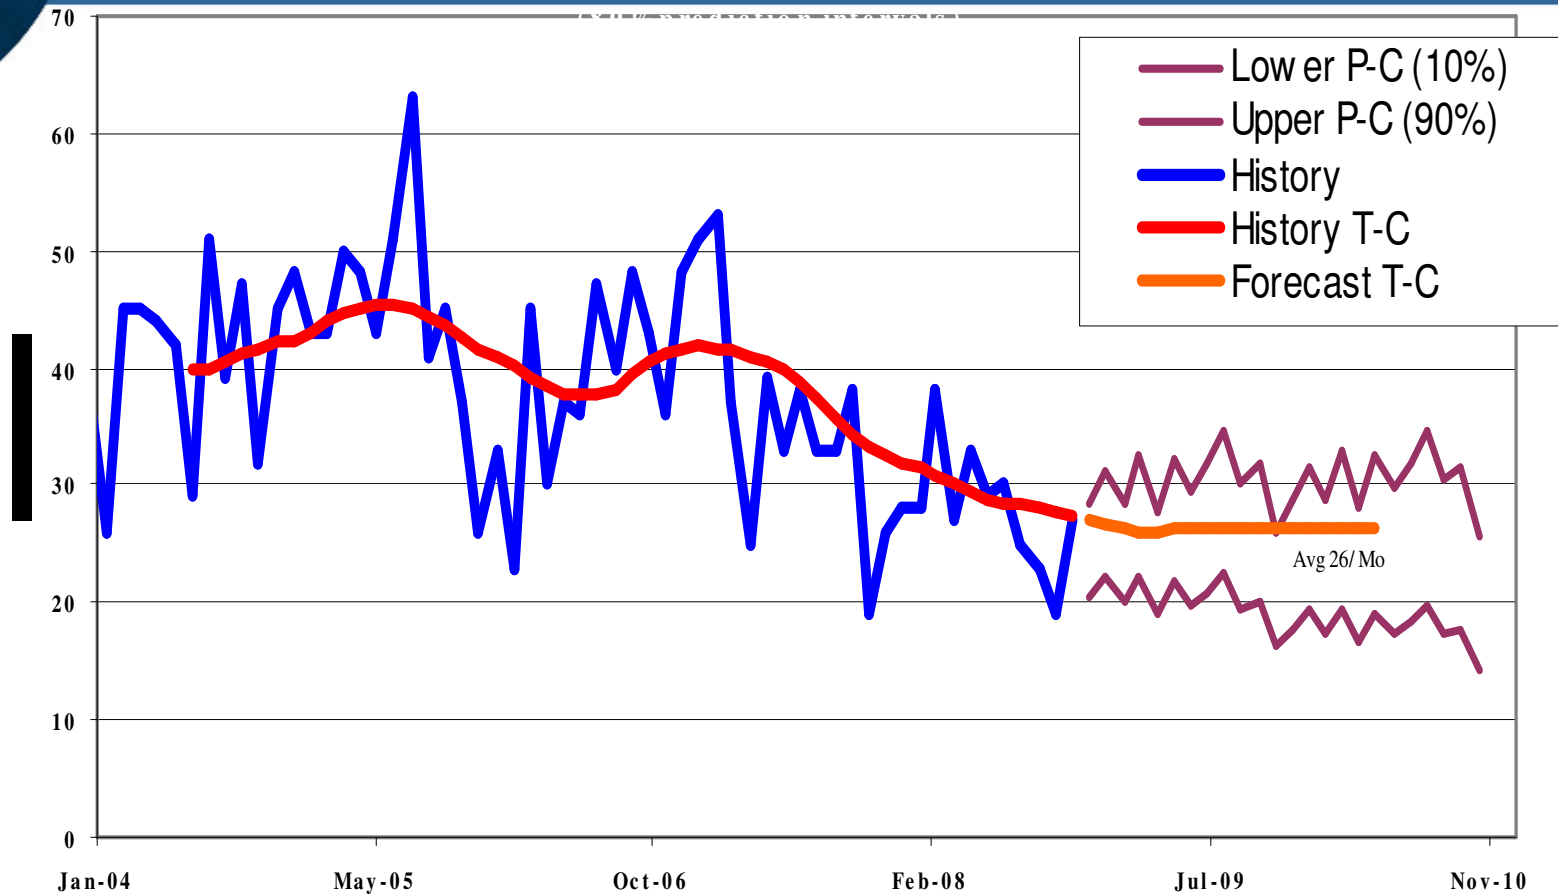

“Replenishment Planning”

Senior Partner In-Patient Activity

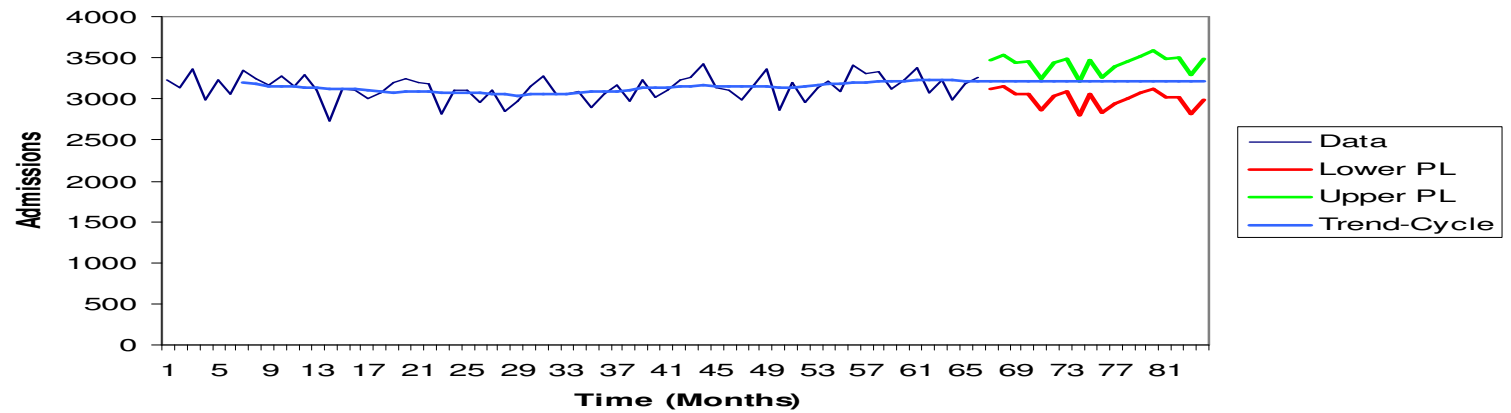

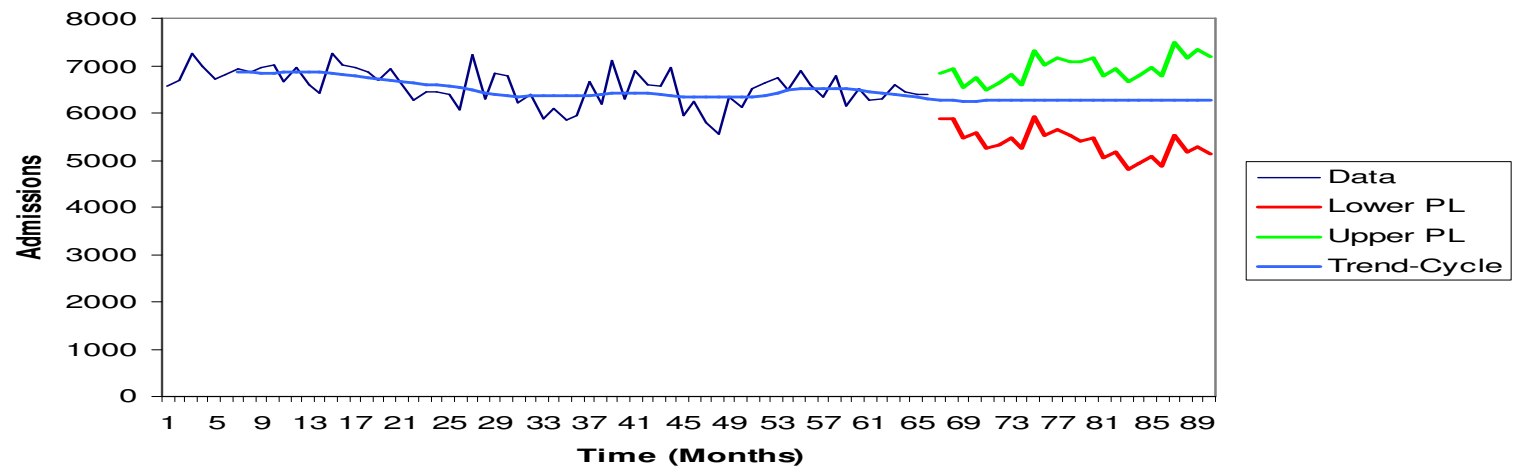

Step 3: Evaluating Performance Diagnostics

Predictive Analytics: Forecasting Service Needs

Maternity (History, Trend-Cycle & Prediction Limits)

Surgery (History, Trend-Cycle and Prediction Limits)

Predictive Analytics Development of Methods

The use of current and past data, in conjunction with statistical, structural or other analytical models and methods, to determine the likelihood of certain future events

Forecasting and Strategic Planning methods cover a range from relatively simple time series models to more advanced techniques such as simulation and advising

**REPORTING &
ADVISING**

**SIMULATION &
SCENARIO PLANNING**

FORECASTING

HL/PS, ISF2010
San Diego, CA

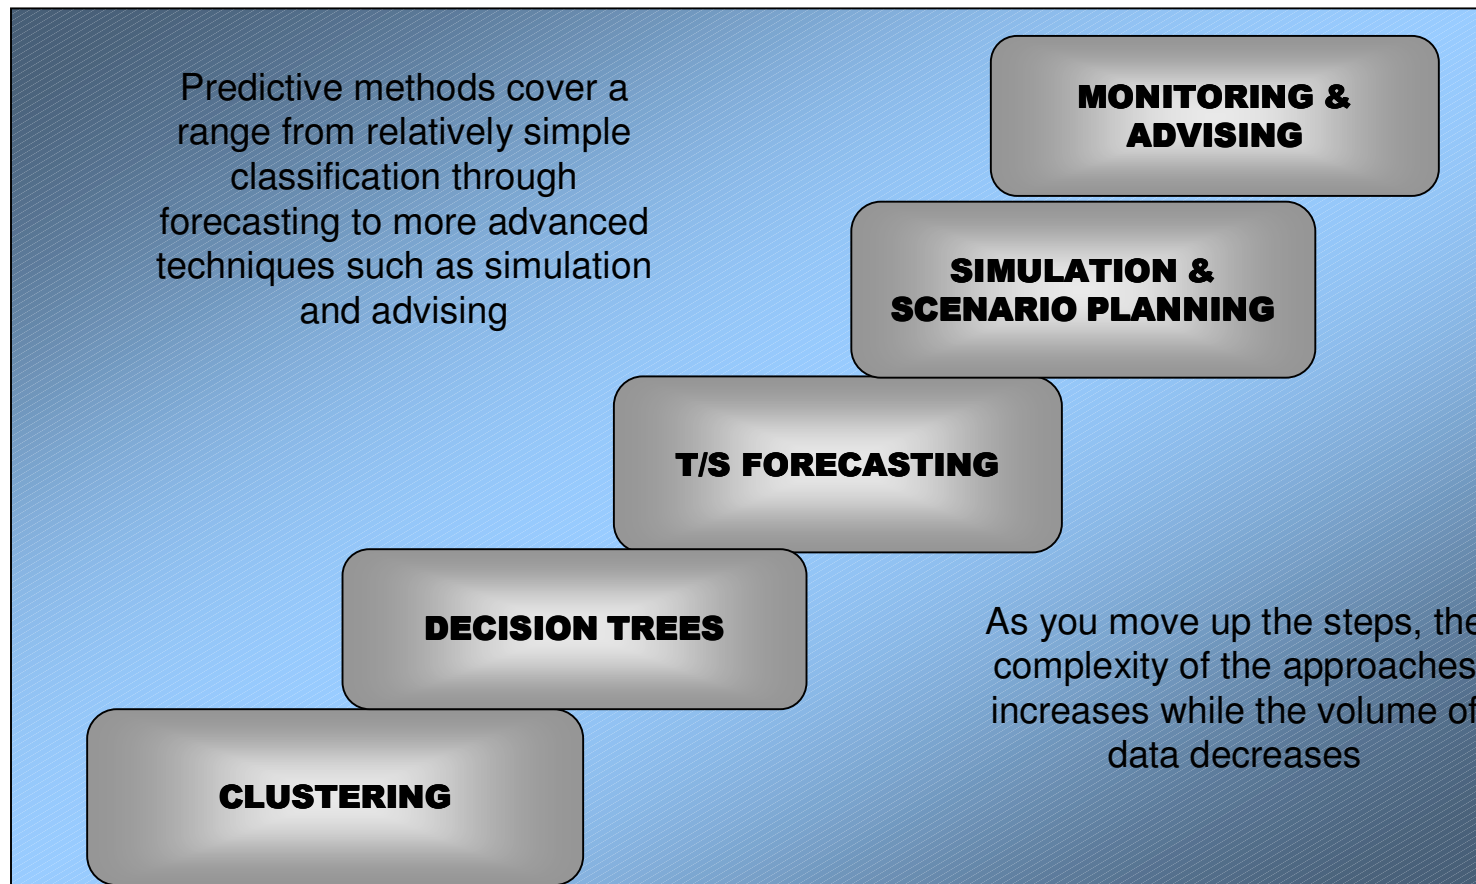

Step 4: Reconciling Multiple Modeling Pathways

Predictive Analytics - Complexity

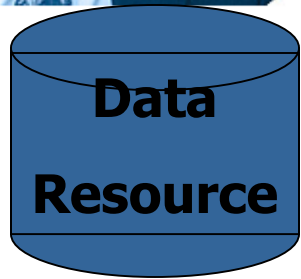

Data Scale versus Complexity of Methods

The use of current and past data, in conjunction with statistical, structural or other analytical models and methods, to determine the likelihood of certain future events

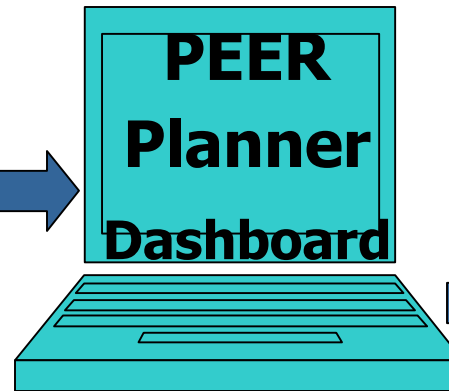

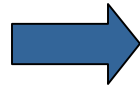

A Modeling Framework for Hospital Management (In the Cloud Software-as-a-Service Model)

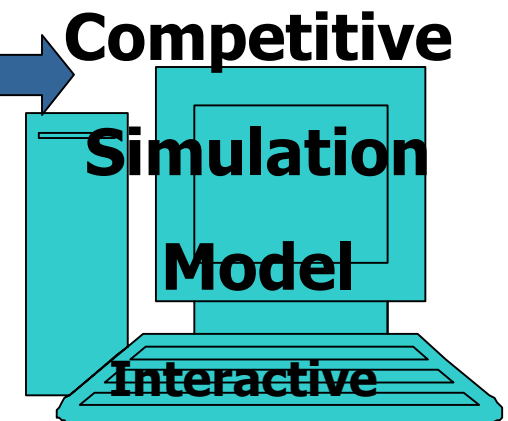

**Multi-year
Multi-hospital
Information**

**Product Line
Trends**
Spatial Analysis
Market Shares
Budget

**Forecasting &
Collaborative
Planning**

Takeaways for Researchers and Grad Students

Forecasting Research Opportunities

- Curing Unhealthy Structured Data
 - Intermittent
 - Missing
 - Transitioning new product intros
 - Consistent, . . .
- Demand Modeling with Structured Relational Datasets
 - Product/Service Hierarchies – 23 Product & 6 Service Summary Levels
 - Place Segmentations – Geo Regions, Payor Class,
 - Period Granularities – Months, Weeks, Days, Hours
- New Challenges for M++ Competitions – scalable methods for ‘very large’ datasets
